

## CIS 90 Linux Lab Exercise

### Lab 2: Using Commands Fall 2010

#### Lab 2: Using Commands

The purpose of this lab is to explore command usage with the shell and miscellaneous UNIX commands.

#### Forum

If you get stuck, have a question or want to share something you learned with this lab then use the CIS 90 Forum at <http://opus.cabrillo.edu/forum/viewforum.php?f=25>

#### Procedure

You must log on to the Opus server using your personal account acquired from turning in lab01. The following questions pertain collectively to the following unix commands:

**banner**  
**bash**  
**bc**  
**cal**  
**clear**  
**date**  
**echo**  
**exit**  
**finger**  
**history**  
**id**  
**man**  
**passwd**  
**ps**  
**type**  
**uname**  
**whatis**  
**who**

Print out a copy of this lab and use it to record the answers to the questions in the lab. You don't need to record the output of the commands.

#### The Shell

1. What shell are you currently using? What command did you use to determine this? (Hint: We did this in Lab 1)
2. Use the following commands as arguments to the type command, to find out where each of the commands resides.

```
cmd argument
type man
type uname
type tryme
type echo
type type
```

3. Use the echo command to find the values of each of the following shell variables.

```
echo $HOME
echo $TERM
echo $LOGNAME
echo $PS1
echo $SHELL
echo $PATH
```

4. Set the TERM environment variable to "dumb", and execute the **clear** command. What does it do? Use **echo \$TERM** to see the new setting. Set TERM back to "vt100" or "ansi" What happens?

```
TERM="dumb"
TERM="ansi"
```

Set the TERM environment variable back to "xterm" which is what it was when you logged in.

5. What happens when you enter the following commands? Why?

```
DATE
Date
date
```

6. What results do you get from the command: **who -g** What program outputs this message?
7. How many arguments do each of the following command lines have?

```
echo one two threefour
echo "My TERM type is " $TERM
echo one.two.three
```

8. What is the difference in output between the following two commands? Note, the \$ and > are part of the prompt, you don't need to type them.

```
$ echo red 'white
> and blue'
```

and

```
$ echo red white \  
> and blue
```

Note: the [enter] key is pressed immediately after the last character of each line.

9. Use the shell metacharacter ";" to write out a one line command that will clear the screen, print out the date and the current month's calendar.

```
$ _____
```

### Commands

10. If you have not already done so, use the **passwd** command to change your password. Name three things you should never do with your password:

1. \_\_\_\_\_

2. \_\_\_\_\_

3. \_\_\_\_\_

11. Using the **uname** command what options would you use to display just the operating system, it's kernel release numbers and the machine's network node hostname? (Hint: Use the **man uname** command)

12. What is the difference in output between the following two commands?

```
banner I am fine  
banner "I am fine"
```

13. Use the **finger** command to find out what guest90's plan is. (Hint: Use guest90 as an argument to the **finger** command.)

guest90's plan:

14. What is your uid (user ID number)? (Hint: we did this in Lab 1)

### Using online documentation

15. Issue a **man bc** command. Use q to quit.

16. What is the **whatis** command? Use the command with the argument, bc

How does this compare to using the man command with -f option?

```
man -f bc
```

17. Is **tryme** a UNIX command? How do you know?
18. Use the manual pages, and the **who** command, to find out the number of users logged on.
19. Run the command: **man -k boot** Use the manual pages to find out what the -k option does. What command is **man -k** equivalent to? Run the equivalent command and verify.
20. Run the command: **info bash** See if you can explore the hot links (marked with a \*). Use the up and down arrows to select a link. Use Enter key to follow a link. Use L to go back to last page. Use Q to quit.
21. Now use your PC browser (outside of Opus) and google "linux bc command". If you find any interesting sites you can post them to the forum.
22. Here's a challenging task: Use the **man** command to discover how you can use the **bc** command to obtain the square root of 361. The **bc** command is an example of an interactive command, because you must enter the numbers to calculate from the keyboard while the program is running.

### Submit this lab

Now that you have finished this lab, you may submit your work using the following two commands:

```
history -a
submit
```

When the command asks you which assignment to submit, respond with 2 followed by the enter key. Then answer the three questions that it asks of you.

### Grading Rubric

27 points	For entering the commands on Opus necessary to do each step of Lab 2. The instructor will scan the commands in your user account's history file and take off a point for any missing commands.
3 points	For correct answers to the three questions asked by the submit script (1 point each)

### Appendix

Questions asked by the submit script:

1. Name a UNIX command that gets its input only from the command line?
2. Name an interactive command that reads its input from the keyboard?
3. Name a UNIX command that gets its input from the Operating System?
