

Final Project

For the final project you will be writing a bash shell script that performs multiple interactive tasks. Your script can automate using some of your favorite commands that you have learned in this course. You will start with a template that you can modify and extend.

Forum

Use the forum to brainstorm script ideas, clarify requirements, and get help if you are stuck. When you have tested your script and think it is bug free then use the forum to ask others to test it some more. Post any valuable tips or lessons learned as well. Forum is at:

<http://opus-ii.cis.cabrillo.edu/forum/>

Commands

.	echo	lpstat	sort
at	env	ls	spell
banner	exit	mail	su
bash	export	man	tail
bc	file	mesg	tee
cal	find	mkdir	touch
cancel	finger	more	type
cat	grep	mv	umask
cd	head	passwd	uname
chgrp	history	ps	unset
chmod	id	pwd	vi
chown	jobs	rm	wc
clear	kill	rmdir	who
cp	ln	set	write
date	lp/lpr	sleep	xxd

Commands by Categories

Type	Commands
Simple:	banner, date, cal, finger, uname, type, ls, tree, cd, pwd, hostname
Status:	jobs, ps, who, id, env, lpstat, umask, mesg, history, tty
File:	file, cp, mv, ln, rm, rmdir, mkdir, touch, chmod, chgrp, xxd, head, tail, stat
Filters:	cat, sort, spell, grep, wc, tee
Misc:	bc, mail, vi, lp, cancel, at, kill, find, passwd

The Template

```
#!/bin/bash
#
# menu: A simple menu template
#
while true
do
    clear
    echo -n "
        CIS 90 Final Project
    1) Task 1
    2) Task 2
    3) Task 3
    4) Task 4
    5) Task 5
    6) Exit

    Enter Your Choice: "
    read response
    case $response in
        1) # Commands for Task 1
            ;;
        2) # Commands for Task 2
            ;;
        3) # Commands for Task 3
            ;;
        4) # Commands for Task 4
            ;;
        5) # Commands for Task 5
            ;;
        6) exit 0
            ;;
        *) echo "Please enter a number between 1 and 6"
            ;;
    esac
    echo -n "Hit the Enter key to return to menu "
    read response
done
```

Procedure

Copy the template from */home/cis90/depot/myscript* to your own *bin/* directory keeping it named **myscript**. Give the file execute permission for everyone. You will run your script by entering its name on the command line just as you do with any other Linux command.

Choose five tasks to implement. For each choice add a menu option and then develop the appropriate case statement. Expand the case statement with commands to query the user for input, then process that input.

Each task that you implement should:

- Be interactive:
 - Prompt the user for input.
 - Save the user's input in one or more variables.
 - Execute one or more commands using the variables as the options or arguments.
- Have at least one non-generic comment.
- Have the minimum number of commands according to the grading rubric below.

Make sure your script can run by itself and run from **allscripts** which is in the */home/cis90/bin* directory. You also need to set permissions so that everyone in the cis90 group can read and execute your script.

When finished, you will need to test your script and repair any defects you find. After your own testing it is helpful to have others test your work. Developers can't always imagine all the creative ways users will use their products. Use the forum to ask other students to run your script and give your feedback. This is also a good way to check your script can be run by others in the cis90 group.

Tips

- Run **allscripts** to see some work Homer, Duke and Benji have developed.
- Duke's work on a front-end to the **grep** command is a good example of the minimum expected for a single task. Duke and Homer still have more work to do when they get back from their walks as not all tasks are completed.
- Benji went a tad overboard on his tasks. He must have been thinking he would get chicken treats. You don't have to do as much as Benji did but you might get some ideas from viewing his work. His script also has many examples of how to do conditionals for other students wanting to go over the top.
- Use **vi** to look at Homer's, Duke's and Benji's scripts in their bin directories. **vi** adds color to make the commands easier to read.
- There are also a number of sample bash scripts in */home/cis90/depot/scripts* you can look at to see how to do some more complex things and get ideas.
- Save earlier versions of your work. You can easily do this by copying **myscript** to *myscript.v1*, *myscript.v2*, etc. to backup each version.

Shell scripting topic ideas

An easier to use find command

View the File System

- Show files at the root (/) directory
- Show files in user's home directory
- Show files in the parent directory
- Show files in a specified directory

Tally Files

- Tally the number of directories from a given starting point
- Tally the number of symbolic links from a given starting point
- Tally the number of text files from a given starting point
- Tally the number of shell scripts from a given starting point
- Tally the number of data files from a given starting point
- Tally the number of symbolic links from a given starting point
- Draw a histogram showing the relative numbers of different file types

Search for files

- Search for a file by name
- Search for a file by inode number
- Search for a file by owner
- Search for a file by size
- Search for files that have been modified recently
- Search for files that contain a certain string of characters

View files

- Select a file for viewing
- View the entire file allowing paging through the file
- View a file in hexadecimal format
- View the top 20 lines of a file
- View the bottom 20 lines of a file

Process status

- Show just system processes
- Show processes belonging to a particular user
- Show any defunct processes
- Show all processes

To turn in

Copy your final version of **myscript** as follows:

```
cp myscript /home/rsimms/turnin/cis90/myscript.$LOGNAME
```
